WORK EXPERIENCE

SENIOR SOFTWARE ENGINEER - SKIP

MAR 2026 - PRESENT

Business Impression Boosting Platform

- Built a paid business visibility boost feature that increased impressions for businesses across the Skip platform through five configurable pricing tiers.
- Implemented the end-to-end boost flow with Next.js, tRPC, Redis, and MySQL, including tier selection, view-threshold logic, and paid activation.
- Helped generate \$33K in MRR by turning business discovery and marketplace visibility into a monetized growth lever.

AI Powered Product Optimization Tools

- Built AI-powered product review tooling that scored user products and generated actionable feedback to improve product listings.
- Implemented one-click AI product improvements for subscribed users, including upgraded product copy plus image and video generation workflows.
- Developed the feature with Next.js, OpenAI SDK, Redis, and MySQL, supporting async generation, persisted results, and subscriber-gated access.
- Helped generate \$27K in MRR by packaging AI product optimization as a premium value driver.

SOFTWARE ENGINEER II - ROCKET LAWYER

OCT 2023 - MAR 2026

Leading the continuous migration of a large-scale legacy web platform

- Legacy web platform (AngularJS, Apache Velocity, Bloomreach CMS) to a modern React / Next.js architecture.
- Migrated pages representing ~10% of total traffic (~1M page views) while supporting 7 paywalls, subscription flows, and running A/B testing / experimentation to validate conversion rate optimization (CRO) impact.
- Achieved major Core Web Vitals improvements: LCP -1000ms, CLS -0.30, INP -120ms through performance optimization and modern rendering strategies.
- Increased platform availability / reliability by 5% (94.98% → 99.999%) by improving deployment processes and system stability.
- Eliminated security risk by reducing open security vulnerabilities from 54 to 0, aligning with secure SDLC and OWASP best practices.
- Improved accessibility (a11y) score from 60/100 to 97/100, aligning with WCAG and inclusive design standards.
- Modernized CI/CD pipelines using Helm, Skaffold, Kubernetes and GCP, transitioning from weekly release trains to daily deployments, reducing deployment-related incidents by 3%.
- Increased unit test coverage from 40% (legacy) to 82.8% (Next.js) using Vitest, Testing Library and Playwright.

Experimentation & Payments Optimization

- Led 41 high-impact A/B and multivariate experiments to optimize paywalls, checkout flows, and subscription conversions that all together generated an additional \$6.2M in net revenue.
- Collaborated with payments, backend, and platform teams to introduce installment payment options and improve checkout reliability.
- Executed phased rollouts, feature flags, and data-driven validation, scaled successful experiments across all paywalls based on performance metrics.

SOFTWARE ENGINEER - IBM

MAY 2019 - OCT 2023

Issue Tracking system

- Transitioned from React Native CLI to Expo ecosystem.
- Implemented EAS Update for over-the-air updates.
- Engineered an innovative release pipeline leveraging Expo Fingerprint for optimized build processes.
- Extended backend capabilities by creating new RESTful API routes.

Prediction Model Algorithm Automation

- Designed and implemented an automated training system.
- Created a monthly cronjob for regular model retraining.
- Utilized S3 bucket as shared volume between prediction model and trainer containers.
